

Midland Bull Test

started incorporating Endovac in the vaccination protocol at processing time in 2013 and has never looked back. Since utilizing Endovac, the number of retreats and chronics has dropped drastically and the usage of antibiotics has decreased as well. The first year using Endovac, the overall **antibiotic bill was reduced by 35-40%** and has held at a similar number each year since. Endovac has a lot to offer not only to the feedlot industry, but the cow/calf segment as well.

With Endovac's unique properties, it is a big component of the vaccination program against gram negative bacteria in a single shot. Not many pasturella vaccines that are currently available provide coverage over both pasturella strains whereas Endovac covers both strains along with all the other benefits, not to overlook the **Immune Stimulant advantage that cranks up the Immune System** and helps with overall response to disease and even treatment, allowing for better overall health in general.

Endovac is implemented at processing time and at booster time along with pre-breeding shots at fertility testing time at Midland.

Furthermore, some of the herds that test their bull calves here at Midland have incorporate it into their regimens as well and the **overall health and performance has been markedly improved.**

ENDO-VAC-Beef®
with Immune Plus®

“The first year using Endovac, the overall antibiotic bill was reduced by 35-40% and has held at a similar number each year since.”
